

Research Question

Is the proportion of current alcohol use different between male and female students?

Data & Variables

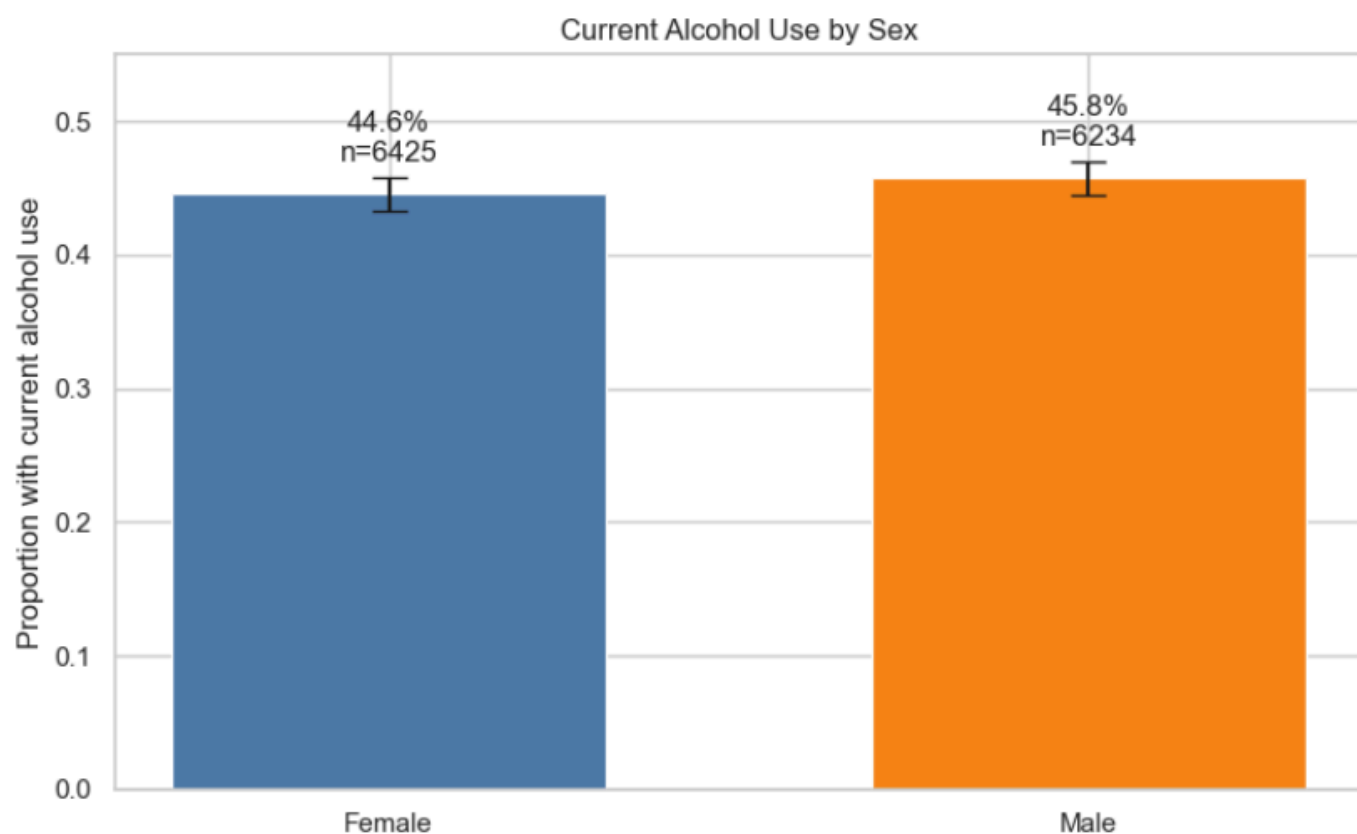

Dataset: YRBS 2007

`1 = current alcohol use`

`0 = no current alcohol use`

Method

- Two-proportion z-test
- Relative Risk (RR)
- Odds Ratio (OR)

Key Results

Female proportion: 44.6%

Male proportion: 45.8%

Difference: 1.2%

95% CI: [-0.5%, 2.9%]

z = 1.344

p = 0.179

RR = 1.03

OR = 1.05

Conclusion

Male students showed a slightly higher alcohol use rate (45.8% vs. 44.6%), but the difference was not statistically significant (p = 0.179).

Therefore, no significant difference was found between the two groups.

	Result	Value
0	Female proportion	44.6%
1	Male proportion	45.8%
2	Difference, Male - Female	1.2%
3	95% CI	[-0.5%, 2.9%]
4	z statistic	1.344
5	p-value	0.178869
